MARKET	Infrastructure & Engineering		

The main objective of this Mobility Plan was to promote a set of measures aimed at reducing the negative impacts derived from mobility in the study environment, motivating a more rational use of the car, making journeys with more than one occupant and balancing the modal distribution towards more sustainable modes of transport, without forgetting the safety of the student in the educational environment.

The plan's strategy sought to overcome the barriers of this centre, characterised by the lack of accessibility by means other than motorised vehicles, due to its location and remoteness from residential areas, together with the absence of alternative routes due to the limited development of road infrastructure in the area.
